# Main Page (1)

The screenshot shows the Oxford Journals website main page. At the top right, there are links for "Sign In" and "Register" (labeled D). The main header features the "OXFORD ACADEMIC" logo and the word "Journals". Below this is a navigation bar with "Journals A to Z" (labeled A), "Journals by Subject" (labeled B), "Customer Services", and "Resources". A search bar with a magnifying glass icon and the text "Advanced Search" is located on the right side of the navigation bar (labeled C). On the left, a dropdown menu for "Journals by Subject" is open, listing "Arts & Humanities", "Law", "Medicine & Health", "Science & Mathematics", and "Social Sciences". Below the navigation bar, there are several promotional tiles: "Part of the academic community" with a background image of a building; "A trusted society partner" with a background image of rowing oars; "Open access" with a background image of an open padlock (labeled with a yellow callout box "Open Access 저널로 이동"); and "Altmetric scores" with a background image of colored pencils. At the bottom, there is a section titled "Resources for.." (labeled E) with four columns: "Authors" (background image of light bulbs), "Librarians" (background image of a library interior), "Societies" (background image of a group of people), and "Sponsors and advertisers".

## Bayesian Models, Delusional Beliefs, and Epistemic Possibilities

Matthew Parrott

Abstract ▲

The Capgras delusion is a condition in which a person believes that an imposter has replaced some close friend or relative. Recent theorists have appealed to Bayesianism to help explain both why a subject with the Capgras delusion adopts this delusional belief and why it persists despite counter-evidence. The Bayesian approach is useful for addressing these questions; however, the main proposal of this essay is that Capgras subjects also have a delusional conception of epistemic possibility, more specifically, they think more things are possible, given what is known, than non-delusional subjects do. I argue that this is a central way in which their thinking departs from ordinary cognition and that it cannot be characterized in Bayesian terms. Thus, in order to fully understand the cognitive processing involved in the Capgras delusion, we must move beyond Bayesianism.

#### Abstract

I defend a radical interpretation of biological populations—what I call population pluralism—which holds that there are many ways that a particular grouping of individuals can be related such that the grouping satisfies the conditions necessary for those individuals to evolve together. More constraining accounts of biological populations face empirical counter-examples and conceptual difficulties. One of the most intuitive and frequently employed conditions, causal connectivity—itself beset with numerous difficulties—is best construed by considering the relevant causal relations as ‘thick’ causal concepts. I argue that the fine-grained causal relations that could constitute membership in a biological population are manifested by different membership as being different constructs, the difference showing that positions of membership depend on a view of the world defended here.

inative and frequently employed conditions, causal connectivity itself beset with numerous difficulties—is best construed by considering the relevant causal relations as ‘thick’ causal concepts. I argue that the fine-grained causal relations that could constitute membership in a biological population are huge in number and many are manifested by degree, and thus we can construe population membership as being defined by massively multidimensional constructs, the differences between which are largely arbitrary. I end by showing that positions in two recent debates in theoretical biology depend on a view of biological populations at odds with the pluralism defended here.
